BY, Symington L.S.;

Submitted (MAY-1996) to the EMBL/GenBank/DDBJ databases.

-!- FUNCŢION: Required for protein transport from the ER to the Golgi
                                                                                                                                                                                                                                                                                                                                                                                              DOMAIN: The rodlike tail sequence is highly repetitive, composed of an heptapeptide repeat pattern characteristic of alpha-helical coiled coils. May form filamentous structures in the cell. SIMILARITY: BELONGS TO THE VDP/USO1/YEL047C FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           174 GAAGATGCAAAAAAAAAGACAAGGCCAATCGGAAGGAG------GAGGATGTC

```
-1. FURUNIT: Muscle Contraction.

-1. SUBUNIT: Muscle mossin is a hexameric protein that consists of 2 heavy chain subunits (MHC), 2 alkali light chain subunits (MLC) and 2 regulatory light chain subunits (MLC-2).

-1. SUBCELLULAR LOCATION: Thick fillaments of the myofibrils.

-1. TISSUE SPECIFICITY: Smooth muscle, expressed in the umbilical artery, bladder, esophagus and traches.

-1. DOMAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils.

-1. DISEASE: A chromosomal rearrangement, known as pericentric inversion Inv(16)(p13;q22), Produces a fusion protein that consists of the 165 N-terminal residues of CBF-beta (PBPB2) with the tail region of MYH1: This rearrangement is associated with acute myeloid leukemia of M4EO subtype.

-1. MISCELLANBOUS: Bach myosin heavy chain can be split into 1 light meromyosin (LMM) and 1 heavy meromyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            from

                                                                                                                                                                                               Isoid=008638-2; Sequence=VSP 003346; DOMAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils. MISCELLANEOUS Each myosin heavy chain can be split into 1 light meromyosin (LMM) and 1 heavy meromyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped

Use of retinoic acid and antisense against the central nervous system-specific POU transcription factor Brn-2."; Circ. Res. 78:395-404(1996).

-I. FUNCTION: Muscle contraction.

-I. SUBJUIT: Muscle contraction.

-I. SUBJUIT: Muscle myosin is a hexameric protein that consists of 2 heavy chain subunits (MHC), 2 alkali light chain subunits (MLC).

-I. SUBJUIT: Muscle CONTION: Thick filaments of the myofibrils.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Subunt: Myosin is a hexameric protein that consists of 2 heavy chain subunits (MHC), 2 alkali light chain subunits (MLC) and 2 regulatory light chain subunits (MLC-2).

DOMAIN: The rodilke tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coils.

SIMILARITY: Contains 1 myosin-like globular head domain.

It later becomes cross-linked to KIF by isodipeptide bonds. It may serve as scaffold protein, together with involucrin, in the organization of the cell envelope or even anchor the cell envelope to the KIF network. It may be involved in its own calcium-dependent postsynthetic processing during terminal differentiation.
SUBUNIT: Homodimer (Probable).
SUBUNIT: Homodimer (Probable).
SUBUNIT: PECIFICITY: Found in the hard keratinizing tissues such as the inner root sheath (IRS) of hair follicles and medulla, and in the filliform papillae of dorsal tongue epithelium (Probable).
DEVELOPMENTAL STAGE: Expressed during late differentiation of the epidermis.

DOMAIN: Consists of nine domains. Domain 1 contains two EF-hand calcium-binding domains. Domains 2-4, 6, and 8 are almost entirely alpha-helical, configured as a series of peptide repeats of varying regularity, and are thought to form a single-stranded alpha-helical rod stabilized by ionic interactions. Domain 6 is the most regular and may bind KIF directly by ionic interactions. Domain 6 is bomains 5 and 7 are less well organized and may induce folds in the molecule. Domain 9 contains the C-terminus, conserved among 524 TrpGlnLeuGlnGluAlaGlnArgArgArgHisThrLeuTyrAlaLysProGlyGln CGGGCATGTCTCCTGCCCCAAGTCCTCCATCATCAGCAGTGATGGTGGTAAGGGCCCCTC probably converted to citrullines by peptidylarginine deimidase. SIMILARITY: In the N-terminal section; belongs to the S-100 SIMILARITY: Contains 2 EF-hand calcium-binding domains. transglutaminase. Some 200 arginines TGGGTTCTTCAAGGGATAAACCAGCGGCGAAAGAACACA----:::|||

Proc. Natl. Acad. Sci. U.S.A. 88:10676-10680(1991).

-!- FUNCTION: Muscle contraction.
-!- FUNCTION: Muscle contraction.
-!- SUBUNIT: Muscle myosin is a hexameric protein that consists of 2 heavy chain subunits (MLC), 2 alkali light chain subunits (MLC) and 2 regulatory light chain subunits (MLC).
-!- SUBCELULAR LOCATION: Thick filaments of the myofibrils.
-!- DOWAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils.
-!- MISCELLANEOUS: Each myosin heavy chain can be split into 1 light... meromyosin (LMM) and 1 heavy meromyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GAGTAATCTTCGACAGGTAGGCCTGAAGAAACCCATGGAACGGTCCTCGGTCCTCGAC 2633

Ketchum A.S., Stewart C.T., Stewart M., Kiehart D.P.,
"Complete sequence of the Drosophila nonmuscle myosin heavy-chain
transcript: conserved sequences in the myosin tail and differential
splicing in the 5' untranslated sequence.";
Proc. Natl. Acad. Sci. U.S.A. 87:6316-6320(1990).
-!- FUNCTION: Nonmuscle myosin appears to be responsible for
cellularization. Required for morphogenesis and cytokinesis.
                                         SEQUENCE FROM N.A. (ISOFORMS LONG AND SHORT).

RT TWOUTONAL Cell expression of inserted isoforms of vertebrate nonmuscle myosin heavy chain II-8.;

RY TWO BIOL Chem. 270:1453-14540(1955).

CC -1- FUNCTION: Cellular myosin appears to play a role in cytokinesis, cell shape, and specialized functions such as secretion and capping (By similarity).

CC -1- SUBUNIT: Myosin is a hexameric protein that consists of 2 heavy capping subunits (MMC).

CC -1- SUBUNIT: Myosin is a hexameric protein that consists of 2 heavy capulatory light chain subunits (MMC) and 2 regulatory light chain subunits (MMC).

CC -1- SUBUNIT: The rodiike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha helical coiled coils.

CYCLES SIMILARITY: Contains 1 myosin-like globular head domain.

CC -1- SIMILARITY: Contains 1 lQ domain.

CC -1- SIMILARITY: Contains 1 lQ domain.

CC death. L-FILIP has cytostatic, neuroprotective and immunosuppressive CC activities. The L-FILIP protein can be used for controlling cell CC migration and cell death, which is applicable in developing drugs for CC treating or suppressing cancer or tumour meterastasis or as requiators of CC cell migration for transplantation therapy, and also for controlling the CC mobility and cell death of nerve cells, promoting decomposition of the CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein in the treatment CC actin-binding protein e.g. filamin-interacting protein e.g. filamin-interacting e.g. filamin-interactin	QY         1 CCACTGGGTTCTTCAAGGGATAAACCAGGGGGGAAAGAACACACCATTGGTTAAGGAGTC 60           Db         1 CCACTGGGTTCTTCAAGGATAAACCAGCGGGAAAGAACACACCATTGGTTAAGGAGTC 60           QY         61 GACAACAGGTGGGAATCACGAAATCAAGGTGGAGAAAGTTCATCATCAACGGGCATG 120           Db         61 GACAACAGGTGGGAATGAGATCACGAAATCAAGGTGGAGAAAGTTCATCATCTAACGGGCATG 120           Db         61 GACAACAGGTGGGAATGAGATCACGAAATCAAGGTGGAGAAAGTTCATCATCATCAACGGGCATG 120	121 TCTCCTGCCCCAAGTCCTCCATCATCAGCAGTGATGGTGAGGGCCCCTCAGAAGATG 121 TCTCTGCCCCCAAGTCCTCCATCATCAGGAGTAAGGGCCCCCTCAGAAGATG 121 TCTCCTGCCCCCAACCTCATCATCAGGATGATGGTGATAAGGGCCCCTCAGAAGATG 181 CAAAAAGAACAAGGCCAATCGGAGGAGGAGGTGTCAGGATTCCAGAAAAGAACAAGGCCAATCGGAAGAGGAGGAGGATGTCATGGCTTCCGGAACTATCAAAA 181 CAAAAAAGAACAAGGCCAATCGGAAGGAGGAGGATGTCATGGCTTCCGGAACTATCAAAA	27 21 0000000000000000000000000000000000	361 TCATCCACATGCTGAGGACAGAGAAACCAAGCCCGAGGTTCTGGAGGCACATGGAT	1	Db   541 AGCAGAAGAGAGACGTACCGCGCATAGCTAGAGCAGCTGCTGGAGAAGTGTCACA 600		Oy 781 GAGATGAGCTTGTGAAGCTCAAGTCCTTCGCCCTCATGTTGGTGGAGAGGCAGATGC 840

S-FILIP has a function of controlling cell migration and cell death. S-FILIP has a function of controlling cell migration and cell activities. The S-FILIP protein can be used for controlling cell migration and cell death, which is applicable in developing drugs for treating or suppressing cancer or tumour metastasis or as regulators of cell migration for transplantation therapy, and also for controlling the mobility and cell death of nerve cells, promoting decomposition of the actin-binding protein e.g. filamin-interacting protein in the treatment of preiventrilcular nodular heterotopia

The invention relates to a polynucleotide comprising a sequence given in the specification, or its mature protein-coding portion, or its complement. The polynucleotide is useful for treating diseases e.g., cancer or neurodegenerative diseases and many others listed in the specification. The present sequence represents a novel human cDNA. Note: The sequence data for this patent did not form part of the printed as specification but was obtained in electronic format directly from USPPO at sequence.html?DocID=20030104529.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic.
immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acids and polypeptides, useful for treating disorders such
